

# 2024\* Water Quality Report

729,000 Constituents | 24% Rely on Private Wells for Drinking Water

### Wetland Loss

More than 195,000 acres of wetlands are categorized as lost but potentially restorable.

### PFAS Sources and Detects

**Watertown**  
There are 185 presumed PFAS sources, and 30% of state-tested wells had at least one of the chemicals in 2023.

### Nitrate Exceedances

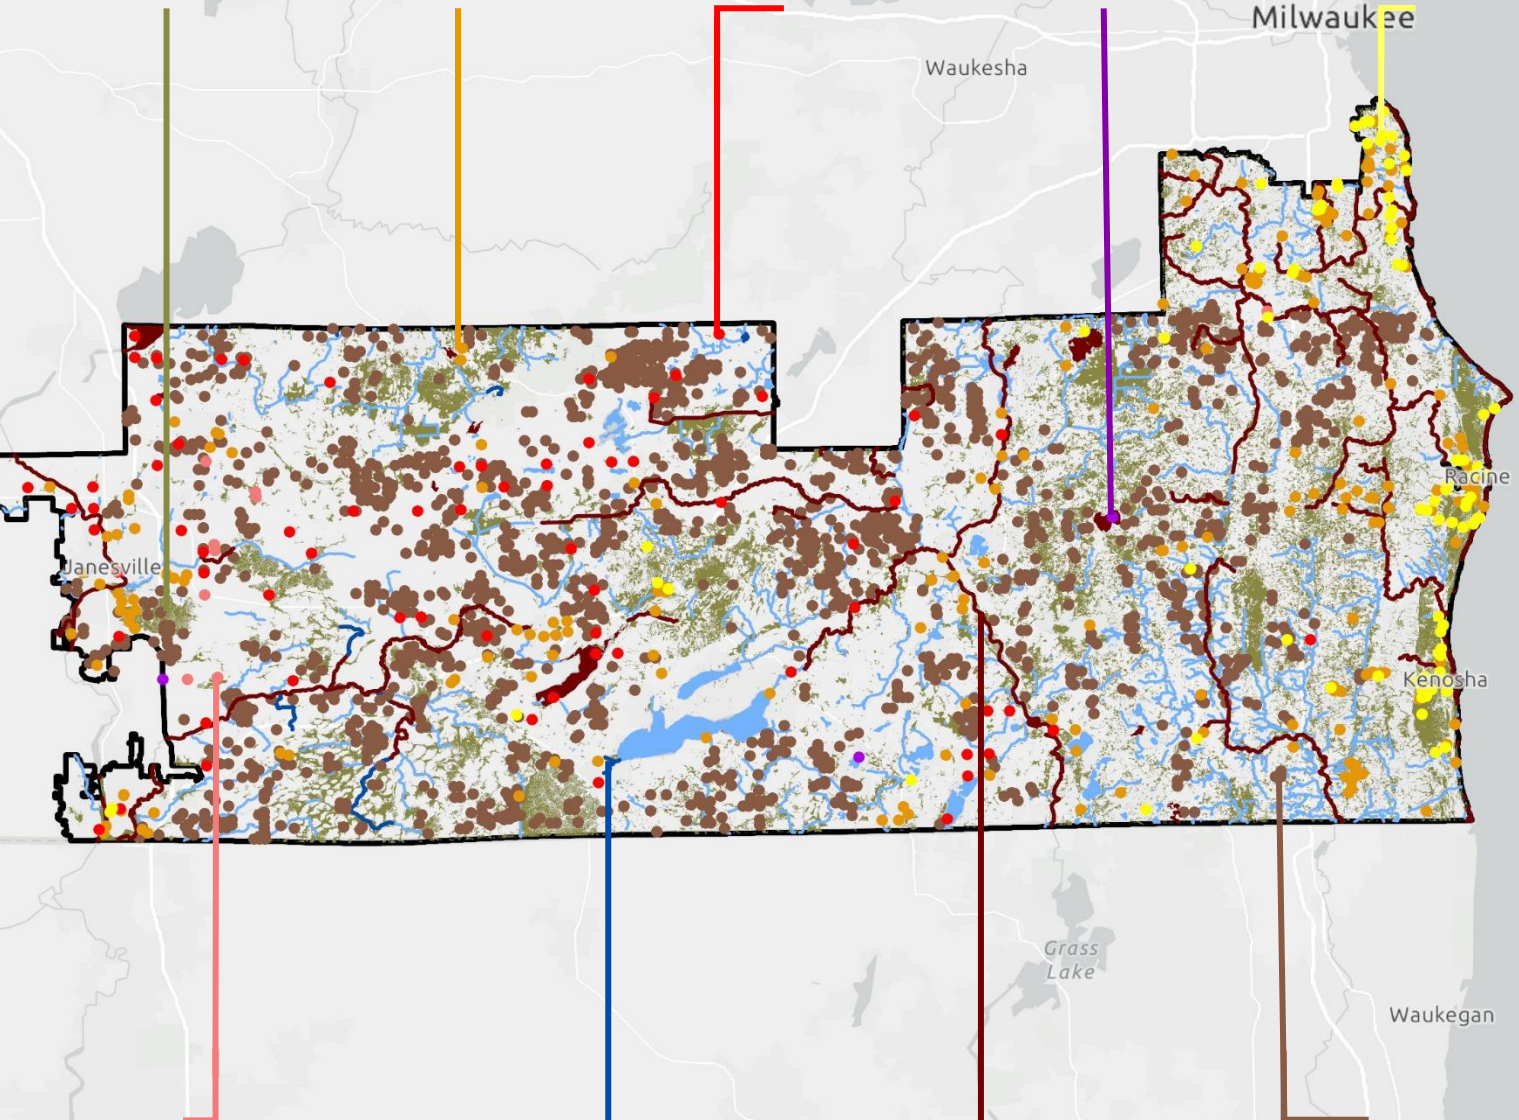

From 2022 to 2024, 43% of public and 8% of private wells sampled exceeded the Preventive Action Limit for nitrate in drinking water.

### Drinking Water Quality Violations

Approximately 1% of public water systems reported contaminant violations between 2022 and 2024.

### Groundwater Contamination Cleanup Sites

Ninety-one groundwater sites are listed as contaminated.

### Neonicotinoid Detects

Between 2019 and 2023, 29% of state-tested wells contained one of three neonicotinoids.

### Outstanding/Exceptional Surface Waters

Almost 4% of total river and stream miles are classified as high-quality surface water.

### Impaired Surface Waters

**Crystal Lake**  
Over 25% of total lake acres and 28% of river and stream miles are listed as impaired.

### Biosolids/Waste Landspreading Sites

Septage, municipal, and industrial wastes are applied to over 66,000 acres.

- **Eight private and 80 public wells sampled exceeded the Preventative Action Limit from 2022-2024.**<sup>1</sup>
- Elevated levels of nitrate are generally due to agricultural runoff and industrial discharges.
- Nitrate has been linked to blue baby syndrome, colon cancer, thyroid disease, and neural tube defects.

- **Current permit holders have applied over 405 million gallons of waste to over 2,200 separate fields.**<sup>2</sup>
- The liquid and solid waste is generated from paper mills, septage operations, and food processing plants.
- Landspreading waste can transport contaminants by contaminating groundwater and food and feed crops in the area.

- **Fifty-eight private and municipal wells tested by the state had detectable levels of PFAS in 2023.**<sup>3</sup>
- The 185 presumed sources include facilities that manufacture, manage, and/or discharge PFAS materials.<sup>4</sup>
- PFAS consumption can cause developmental effects in children, decreased fertility, and some cancers.

- **From 2019-2023, nine private and monitoring well samples contained one or more neonicotinoids**<sup>5</sup>
- Neonicotinoid insecticides are applied to agricultural crops, lawns and gardens, golf courses, and more.
- Negative impacts to non-target insect species cause food chain issues in fish, birds, and potentially other taxa.

- **Lead, radium, bacteria, and/or nitrate at federal violation levels were found in three public water systems.**<sup>6</sup>
- These contaminants often enter drinking water from natural sources, septic systems, and agricultural operations.
- Sustained ingestion at high levels can cause cancer, gastrointestinal issues, and/or numerous other health impacts.

- **Ninety-one groundwater sites are contaminated with solvents, gasoline, and/or volatile organic compounds.**<sup>7</sup>
- These chemical mixtures enter water through industrial discharges, underground storage tank leaks, and landfill leachate.
- If ingested through drinking water, the pollutants pose serious cancer and organ damage health risks.

- **Of the thousands of wetland acres lost, over 19% of the total land acreage has the potential for restoration.**<sup>3</sup>
- Degradation and loss of Wisconsin wetlands is primarily due to invasives, development, and conversion to cropland.
- Wetlands absorb pollutants before they enter water, including drinking water; without them, we lose natural filters.

- **More than 10,300 acres and 320 miles of surface waters are listed as impaired under the Clean Water Act.**<sup>3</sup>
- The mercury, phosphorus, metal, bacteria, and/or PCBs throughout are often from agricultural and industrial discharges.
- Ingestion of these pollutants can lead to organ damage, cardiovascular and reproductive issues, cancer, and more.

- **Over 40 miles and 95 acres of surface waters are classified as Outstanding or Exceptional Waters by the state.**<sup>3</sup>
- These waterbodies support fisheries and wildlife and have high water quality from effective management and protection.
- As some drinking water is sourced from surface water, these are essential public health resources, too.
